Questions And Answers. Below are examples to understand the concept of direct and inverse proportion in a better way.

*Direct and Inverse
Proportion - Definitions,
Formulas ...*

It is an Inverse Proportion:
As the number of people goes up, the painting time goes down. As the number of people goes down, the painting time goes up. We can use: $t = k/n$. Where: t = number of hours; k = constant of proportionality; n = number of people "4 people can paint a fence in 3 hours" means that $t = 3$ when $n = 4$

*Directly Proportional and
Inversely Proportional*

k is a positive number, if x
and y are in direct
proportion or vary directly.

In case of direct
proportion, if y_1, y_2 are
the values of y
corresponding to the values
 x_1, x_2 of x respectively,
then $\frac{y_1}{x_1} = \frac{y_2}{x_2}$. • Two
quantities x and y are said
to be in inverse proportion
if an increase in x causes a
proportional decrease in y
and vice-versa, in
