Summary. Modern infectious disease epidemiology makes heavy use of computational model-based approaches and dynamical systems perspective. The importance of analyzing infectious diseases in such a way keeps increasing. However, infectious disease epidemiology is still often taught mainly from a medical and classical epidemiological study design (e.g., cohort, case-control) perspective.

Epidemiology is based on two fundamental assumptions. First, the occurrence of disease is not random (i.e., various factors influence the likelihood of developing disease). Second, the study of populations enables the identification of the causes and preventive factors associated with disease.

One of the central concepts of epidemiology is the exposure of an individual to a potential disease-causing agent or substance. In case of an infectious disease, their exposure to infectious agents - a pathogen - can lead to infection, but does not necessarily lead to disease.
