Analysys Mason's Next-Generation Wireless Networks programme researches the operator network migrations that will enable these use cases. The underlying technologies (such as virtualised-RAN, massive MIMO antennas, edge computing and 5G cloud-native standalone (SA) core) will all play vital roles in the delivery of these services.

Next-Generation Wireless Networks | Analysys Mason

The next-generation network is a body of key architectural changes in telecommunication core and access networks. The general idea behind the NGN is that one network transports all information and services by encapsulating these into IP packets, similar to those used on the Internet. NGNs are commonly built around the Internet Protocol, and therefore the term all IP is also sometimes used to describe the transformation of formerly telephone-centric networks toward NGN. NGN is a different concept
