Parenteral nutrition in general is required if nutritional needs cannot be met by oral or enteral feeding. In the paediatric patient, its initiation depends both on individual circumstances and the age and size of the infant or child. This compact reference work on parenteral nutrition in children is based on the 'Guidelines for Paediatric Parenteral Nutrition' that have been developed jointly by the European Society for Paediatric Gastroenterology, Hepatology and Nutrition (ESPGHAN) and the European Society for Clinical Nutrition and Metabolism (ESPEN), in

collaboration with the European Society for Paediatric Research (ESPR). These guidelines were based on systematic literature reviews as well as a formal consensus process of a multidisciplinary panel of professionals. However, as a result of the scarcity of good quality clinical trials in children, many of the recommendations were extrapolated from adult studies and based on expert opinion. A detailed analysis of the available data was performed, and for each statement, the level of evidence and grade of recommendation was assessed. This reference guide has been conceived as an aid for the treating physician to assist him in the decision process, thus being a valuable companion in clinical practice.

Practical Reference Guide reviews nutritional assessment using three complementary methods, namely, clinical nutritional assessment (symptoms: physical wasting, rickets), anthropometric assessment (manifestations: abnormal measurements, skinfold thickness), and biochemical assessment (analysis: hematology, urine). The text also addresses nutrition in pregnancy and its effects on the fetus. The book notes that selected food supplementation has negligible effects in the mean fetal weight of malnourished populations compared with well-nourished populations. Placental insufficiency can also lead to fetal malnutrition. The text discusses breast feeding, cow's milk formulas, soya-based formulas, and "follow-on formulas." For low birth weight infants, the choice of feeds are the infants' own mothers' milk, expressed or banked; other banked breast milk; fortified human milk (own mother's

or banked); standard infant formula; or preterm infant formula. The book also explores the problem of weaning and failure to gain height or weight at the expected rates. The book is helpful for pediatricians, obstetricians, gynecologists, nurses, practitioners in general medicine, and administrators of public health services.

This book offers health professionals the scientific rationale for parenteral nutrition, the basic techniques needed for successful parenteral nutrition support, and ways to avoid complications. It presents the basic concepts necessary for the safe delivery of parenteral nutrition, including metabolism of protein, and carbohydrate and fat; electrolytes, minerals; practical application of parenteral nutrition; and it discusses special pediatric conditions in which parenteral feeds are indicated and useful.
