~~Rumen microbiology Bacteria, protozoa, and fungi exist together in the cow ' s rumen. Bacteria make up about half of the living organisms but do more than half of the rumen ' s digestive work. Rumen bacteria are classified into fiber digesters, starch and sugar digesters, lactate using bacteria, and hydrogen-using bacteria.~~

~~Rumen bacteria occur in the intestines of ruminants and nonruminant herbivores, and in omnivorous animals such as man. The rumen is a continuous culture of long turnover time, about a day, in which micro-organisms are mixed with incoming foodstuffs by contraction and expansion of the rumen wall and by rumination.~~

~~Rumen Bacteria — ScienceDirect~~

~~Rumen microbiology. Vertebrates lack the ability to hydrolyse the beta [1 – 4] glycosidic bond of plant cellulose due to the lack of the enzyme cellulase. Thus, ruminants must completely depend on the microbial flora, present in the rumen or hindgut, to digest cellulose. Digestion of food in the rumen is primarily carried out by the rumen microflora, which contains dense populations of several ...~~

~~The rumen is a complex ecosystem composed of anaerobic bacteria, protozoa, fungi, methanogenic archaea and phages. These microbes interact closely to breakdown plant material that cannot be digested by humans, whilst providing metabolic energy to the host and, in the case of archaea, producing methane.~~
